Online Shopping - Shoppe Certified

STORE ID	MONTHLY SOLD	STORE REVIEW	CHAT RESPONSE %	SHOPPE MALL CERTIFIED
1	10.5K	5	79%	YES
2	12.7K	4.5	67%	NO
3	5.5K	4.1	95%	YES
4	11.8K	2.5	80%	YES
5	9.5K	3	10%	NO

Target Attribute: SHOPPE MALL CERTIFIED

doesn't need to be predicted

The benefits that a company can get for predicting the target attribute is assurance and trust. Assurance because it will give the company a sense of confidence that the product they will be getting from the store is true to what they are selling in the app. Trust because it will give the company a good judgement knowing that shoppe itself certified ~~the~~ store, giving the company meaning to where they can be in confidence saying that this store is certified by shoppe, so it must sell quality and trusted products.

I think the four predictor ~~attribute~~ will work well in predicting the given attribute because 3 of the 4 attributes is qualities of each store. I say 3 because the first attribute is only store ID and will not have any contribution to the prediction. For the 3 attributes they will work well since they are solely based on the given qualities of each store meaning that each attribute represents how well the store has done to get the shoppe mall certified.

TEST 11

1) I think Sigmoid curve model is a poor choice for predicting continuous outcomes because continuous outcomes is for linear regression which is numerical and logistic regression is categorical. Using a Sigmoid curve for predicting continuous outcomes will be not enough to represent the outcomes. That will be like showing one result of your many results and hiding the rest. When it comes to the line, I think it will only be constant with no pattern unlike with a normal scatterplot it shows you when the line will go but for Sigmoid curve it has to have a threshold and without it, ~~we won't~~ ~~know~~ how ~~to~~ it will be harder to determine its value.

2) If the model outputs a value of 0.15 meaning it will be under the threshold if we put the threshold on 0.5 and the likelihood to happen is the curve will start at the bottom. Since the value is 0.15, its near to 0.1, so I think the student will Pass.

don't discuss %

3) Predicting someone is healthy when they are actually sick is giving injustice to the patients health and injustice to the patients lives. Especially in the Philippines with how expensive healthcare is without insurance.

Not only you're giving false hope to your patients but you're giving false hope to their families and wasting their money.
